(a) $\log_{10}|\hat{P}|$ of the photograph
(zero frequency at the centre)

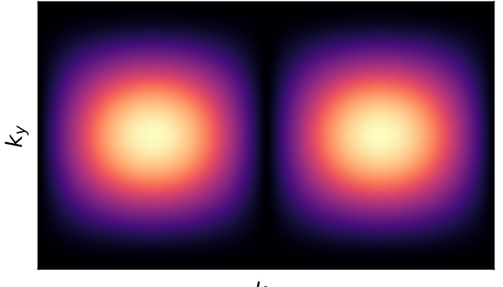

(b) low pass: keep $|k| \le 25$ cycles per image

(c) high pass: keep $|k| > 25$

(d) gain $|\hat{h}|$ of the Sobel filter, $4|\sin\Omega_x|(1+\cos\Omega_y)$,
$\Omega_x = 2\pi k_x/W$, $\Omega_y = 2\pi k_y/H$

(e) Sobel by FFT; max difference to the
direct cross-correlation: 3e-15
